

## Jack's Cool Toys

*This page is dedicated to hardware and software devices that we've found useful in the world of digital imaging. We will add and update this page as new cool toys appear on the marketplace or we purchase them for the Oregon Coast Digital Center. Each toy will contain a brief description of why we consider it cool, and a link so that you can find out even more.*

One of the most popular wide angle lenses both topside and underwater is the Nikon 10.5 fisheye. If you find that the distortion in the image is too much on the edges, you can use the Image Trends Fisheye-Hemi Plug-in filter to correct the image, and make it look more like a corrected super wide angle lens. Objects that curve at the edge of the frame are corrected more than objects in the center. This filter works with all types of fisheye lenses from circle fisheye to full frame, and cropped fisheye images.

### Fisheye-Hemi Plug-In

[Web show of samples topside and underwater.](#)

The original is on the left for the vertical pairs, and the top for the horizontal pairs.
